

Expecting Twins?

Twins are becoming more common with the increase in older mothers.

The market-leading NIPT (noninvasive prenatal testing), Panorama™, now provides more comprehensive screening specifically for multiples.

Seeing double?

Panorama not only can tell you whether your twins are identical or fraternal. Panorama is the only non-invasive prenatal test, or NIPT, that can distinguish between each twin's DNA, which means we can tell you:

- Whether your twins are identical (from the same egg) or fraternal or non-identical (from separate eggs)
- The gender of each twin (2 girls, 2 boys, or 1 girl and 1 boy!)

Knowing whether twins are identical can impact the care plan your healthcare provider will create for you.

Identical twins may share a placenta, which can increase the chance for unequal growth and a condition called twin-twin transfusion syndrome (TTTS). Fraternal twins are not at risk for TTTS. Knowing whether twins are identical helps healthcare providers determine the appropriate amount of follow-up and what specialists may be necessary for your pregnancy.

Panorama helps identify risk for more conditions than any other NIPT for twins

Panorama can provide risk evaluation for:

- Down syndrome, Edwards syndrome, and Patau syndrome
- Turner syndrome, a genetic disorder that occurs in girls that is associated with heart defects, learning difficulties, and infertility*
- 22q11.2 deletion syndrome, a genetic disorder that occurs in boys and girls that is associated with learning differences, heart defects, and other birth defects*

*Risk evaluation available for pregnancies determined by Panorama to involve identical twins
